Project Vision - Expense Tracker Web App

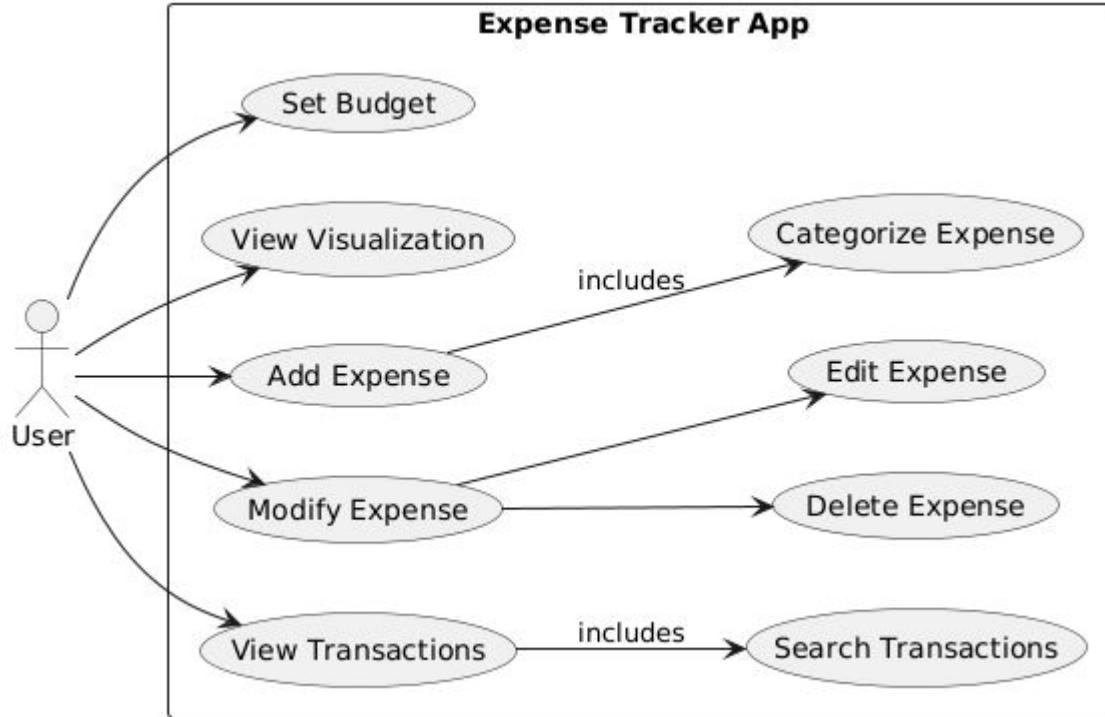

A user-friendly platform for managing personal finances by tracking expenses, setting budgets, and analyzing spending patterns.

- Add, edit, delete, and categorize expenses
- View and search transactions with filters
- Set budgets and monitor spending
- Visualize data with charts and graphs

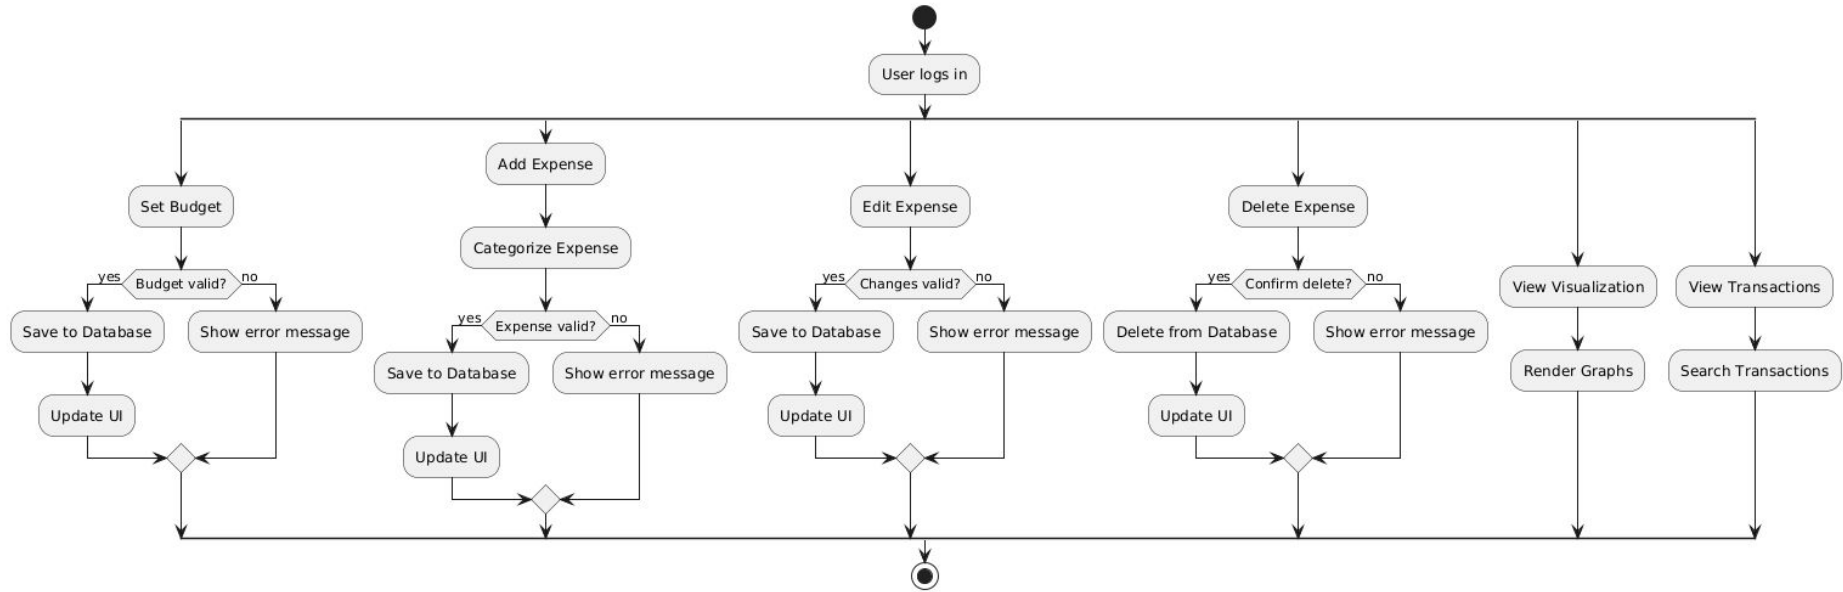

Object-Oriented Design (OOD) principles to be used:

- **Encapsulation:** Classes like **Expense**, **User**, and **Budget** will encapsulate relevant data and behaviors, ensuring controlled access through methods.
- **Abstraction:** Users will interact with high-level functionalities (e.g., adding expenses, viewing transactions), while implementation details like data storage and filtering remain hidden.
- **Polymorphism:** Different actions like modifying expenses (edit/delete) and generating various visualizations (bar, pie, heatmap) will be handled through method overriding and dynamic behavior.
